AuthorsDonna Bergmark¹, Carl Lagoze¹, Alex Sbityakov¹¹Cornell Digital Library Research Group**Abstract**

Crawling the Web to build collections of documents related to pre-specified topics became an active area of research during the late 1990's, crawler technology having been developed for use by search engines. Now, Web crawling is being seriously considered as an important strategy for building large scale digital libraries. This paper covers some of the crawl technologies that might be exploited for collection building. For example, to make such collection-building crawls more effective, focused crawling was developed, in which the goal was to make a "best-first" crawl of the Web. We are using powerful crawler software to implement a focused crawl but use tunneling to overcome some of the limitations of a pure best-first approach. Tunneling has been described by others as not only prioritizing links from pages according to the page's relevance score, but also estimating the value of each link and prioritizing them as well. We add to this mix by devising a tunneling focused crawling strategy which evaluates the current crawl direction on the fly to determine when to terminate a tunneling activity. Results indicate that a combination of focused crawling and tunneling could be an

Title: A user evaluation of subject based information gateways: case study ADAM

Author(s): Maria Monopoli, David Nicholas

Journal: Aslib Proceedings

ISSN: 0001-253X

Year: 2001 **Volume:** 53 **Issue:** 1 **Page:** 39 - 52

DOI: 10.1108/EUM0000000007036

Publisher: MCB UP Ltd

Abstract: Nowadays, end-users have quick and direct access to massive amount of information available on the Net. However, this information is unorganized expecting users to be able to identify and evaluate it in accordance with their information needs. Subject based information Gateways SBIG, organized collections of networked information, provide users with a catalogue of authoritative Internet resources, which can be searched and/ or browsed. This paper provides an evaluation of one such gateway - the Art, Design, Architecture & Media Gateway ADAM. It provides information on who these users are, how often they use the service, what their reasons for use are, which search methods and services they prefer and what are the advantages and disadvantages of an online information service.

Title: The use and usefulness of functions in electronic journals: the experience of the SuperJournal Project

Author(s): Ken Eason, Liangzhi Yu, Susan Harker

Journal: Program: electronic library and information systems

ISSN: 0033-0337

Year: 2000 **Volume:** 34 **Issue:** 1 **Page:** 1 - 28

DOI: 10.1108/EUM0000000006924

Publisher: MCB UP Ltd

Abstract: This paper examines the general value to users of a range of electronic journal functions and their usefulness in the specific context of the SuperJournal Project. For the evaluation of each of the functions three types of data were analysed in relation to each other and in light of other contextual data: logged data of usage, survey data on user satisfaction, and survey data on the perceived importance of the function. The analysis shows that basic browsing, printing and search make up the core functions of electronic journals; other functions, such as saving of bibliographic data, alerting, customising, links with external resources and communication, serve as peripheral functions. The usefulness of both the core functions and the peripheral functions in a specific service is influenced by various implementation factors. However, it is the realised usefulness of the core functions which determines the use of a service.
